

NetBeans Example

Create the first RESTful web service using netbeans as follows.

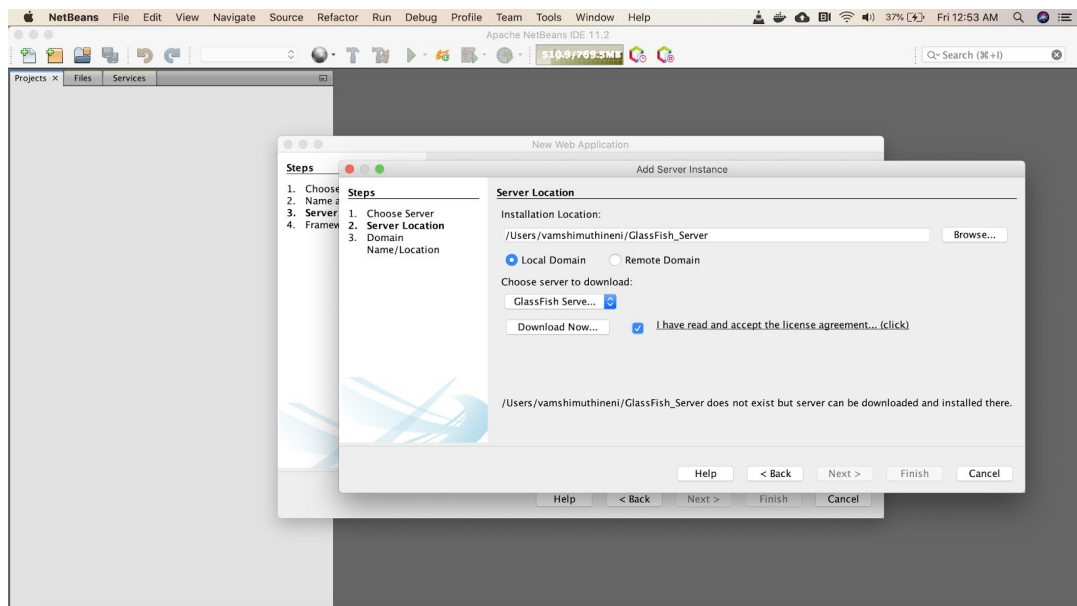

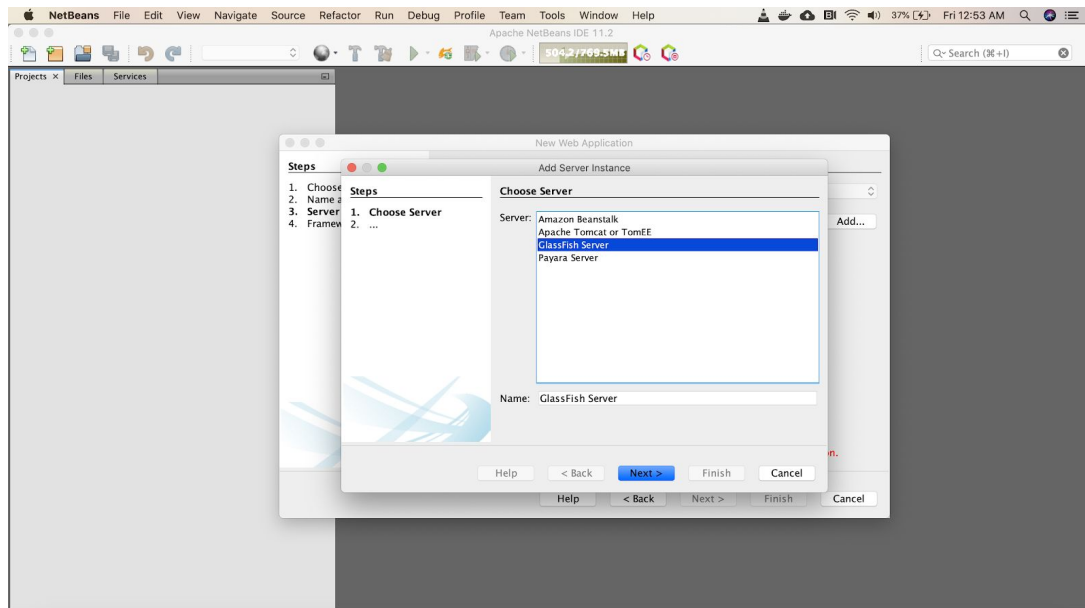

Download Netbeans IDE 8.2 from <https://netbeans.org/downloads/8.2/>

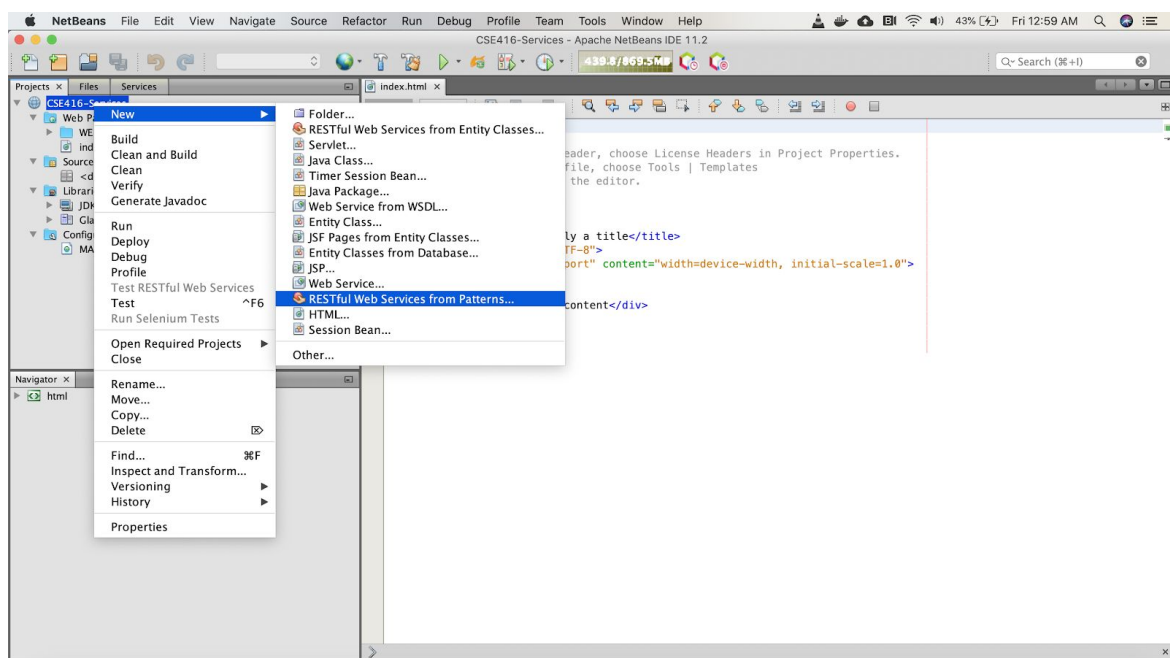

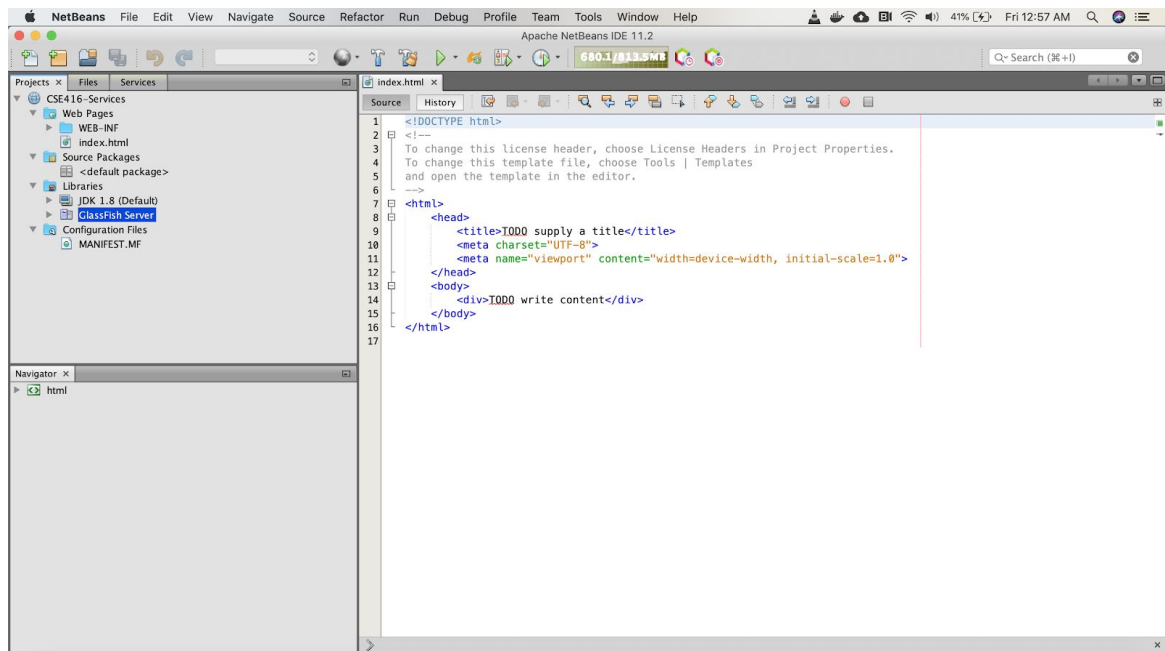

Download the versions which support Glassfish or tomcat servers, from the page.

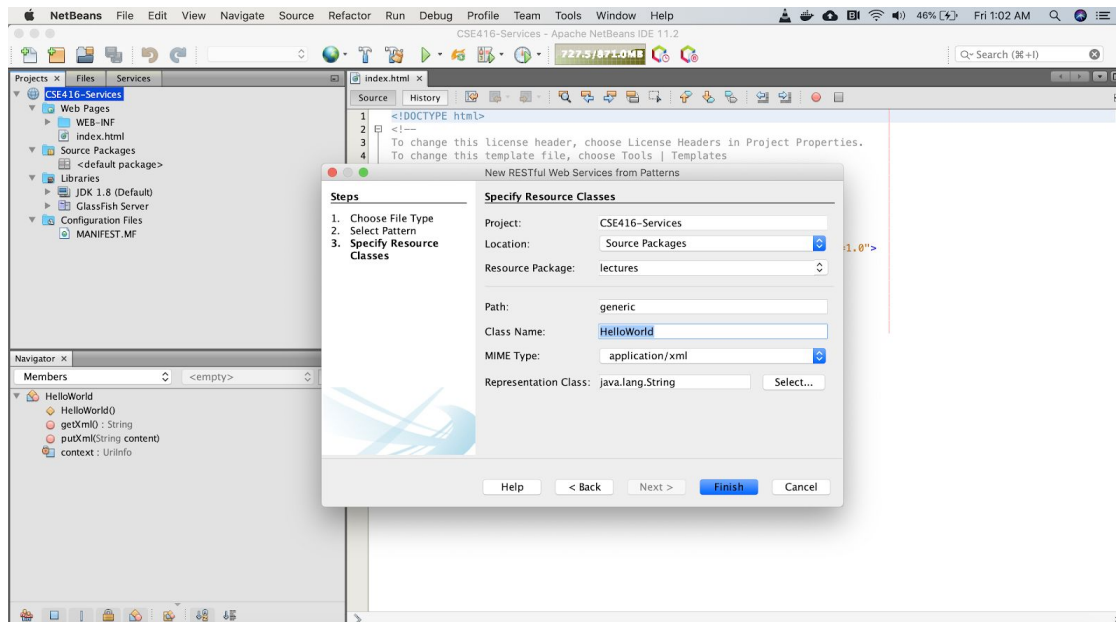

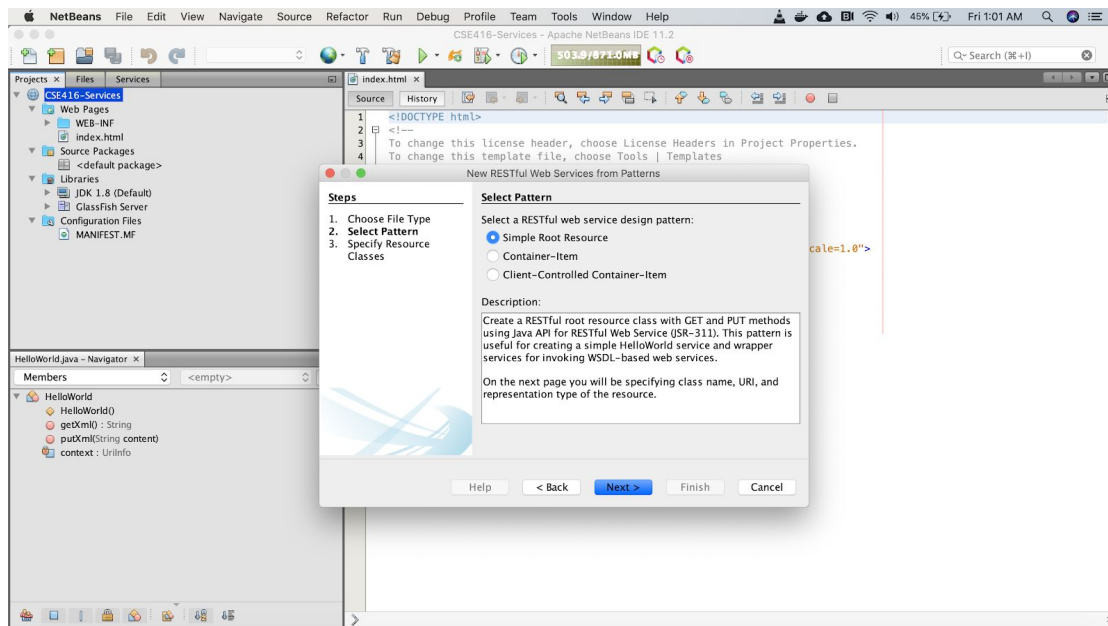

After installing, Create a new project.

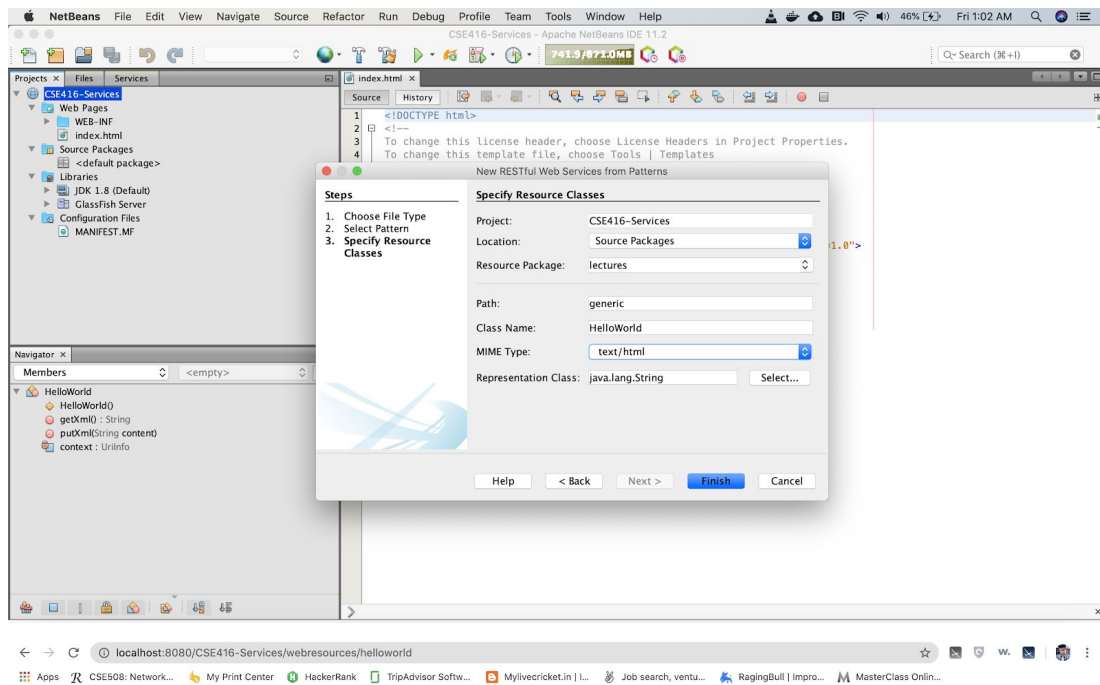

Install a glassfish server.

Hello, World!

The service is up and running....

Note: 1. This example setup is from Mac but for other environments also it won't differ much.
2. If your Glassfish server is up and running, but the application is not getting deployed, try disabling Netbeans proxy settings(Preferences -> Proxy Settings -> No Proxy).
